

3.2 Incident Application

Phase 3 - System and Configuration Setup | Implement Client Script & UI Policy (Incident)

1. About the Incident Application

The Incident application in ServiceNow supports the ITIL incident management process. It allows users to log incidents, assign them to groups, track progress and resolve them within agreed service levels. It is the application on which this project's customizations are applied.

2. Important Modules

Module	Purpose
Create New	Opens a blank Incident form to log a new incident
Assigned to me	Lists incidents assigned to the logged-in user
Open	Lists all incidents that are not resolved or closed
Unassigned	Lists open incidents without an assignee
All	Lists all incident records

3. Incident Life Cycle

State	Meaning
New	Incident is logged and awaiting action
In Progress	Incident is being worked on by an agent
On Hold	Work is paused, for example awaiting caller information
Resolved	A resolution has been provided
Closed	Incident is completed and no further changes are expected
Canceled	Incident is no longer required

4. Relevance to the Project

The State and Priority values of the incident directly drive the UI Policy conditions and the Client Script, so a proper understanding of the Incident application is essential for accurate implementation.
