

5.1 Introduction to UI Policies

Phase 5 - UI Policy Implementation | Implement Client Script & UI Policy (Incident)

1. What is a UI Policy?

A UI Policy is a rule-based feature of ServiceNow that dynamically changes the behaviour of fields on a form. It evaluates one or more conditions and, depending on the result, applies actions such as making a field mandatory, visible or read-only. UI Policies work on forms and can also be applied to lists.

2. Components of a UI Policy

Component	Description
Table	The table on which the policy applies (Incident)
Short description	A meaningful name for the policy
Conditions	Filter that decides when the policy is applied
Reverse if false	Undoes the actions when the condition becomes false
On load	Also evaluates the policy when the form loads
UI Policy Actions	Per-field settings: Mandatory, Visible, Read-only
Script (optional)	Execute if true / Execute if false for advanced logic

3. Field Behaviours

Behaviour	Effect on the Field
Mandatory	Field must contain a value before the form can be saved
Visible	Field is shown or hidden on the form
Read-only	Field is displayed but cannot be edited

4. Advantages

- Configured through a simple interface with little or no coding.
- Automatically applied on form load and on each relevant field change.
- Easy to maintain and understand by administrators.
