

1.1 Project Overview

Phase 1 - Project Introduction | Implement Client Script & UI Policy (Incident)

1. Introduction

This project, **Implement Client Script & UI Policy (Incident)**, demonstrates how client-side customization can be applied to the Incident form in the ServiceNow platform. The Incident form is the primary interface used by service desk agents to record, classify, prioritize and resolve IT issues. By adding a Client Script and UI Policies, the form is made dynamic, so that it reacts immediately to user input without needing a server round-trip.

2. Project Details

Item	Description
Project Title	Implement Client Script & UI Policy (Incident)
Platform	ServiceNow (Personal Developer Instance)
Application / Module	Incident Management (Service Desk)
Target Table	Incident [incident]
Customization Type	Client-side: Client Script and UI Policy
Application Scope	Global
Access Role	System Administrator (admin)

3. Overview of the Solution

The solution consists of two complementary components configured on the Incident table. A **Client Script** (onChange type) runs in the user's browser when the Priority field changes and displays a guidance message to the agent when a critical incident is raised. **UI Policies** control field behaviour dynamically by making fields mandatory, visible or read-only depending on conditions such as State and Priority.

4. Key Features

- Dynamic, real-time behaviour on the Incident form without page reload.
- Guidance message for critical (Priority 1) incidents through an onChange Client Script.
- Conditional mandatory, visible and read-only field behaviour through UI Policies.
- Improved data quality because required information is captured at the right time.
- Configuration performed using standard ServiceNow features with no external tools.

5. Tools and Technologies

Component	Usage
ServiceNow Platform	Cloud-based ITSM platform used for implementation
Client Script	JavaScript executed on the client browser
UI Policy	Rule-based, no-code/low-code form behaviour control
g_form API	Client-side API used to read and modify form fields
Web Browser	Used for form access and validation of behaviour
