

1.2 Project Background

Phase 1 - Project Introduction | Implement Client Script & UI Policy (Incident)

1. ServiceNow

ServiceNow is a cloud-based platform-as-a-service (PaaS) widely used for IT Service Management (ITSM), IT Operations Management and enterprise workflow automation. It provides a single system of record where requests, incidents, problems and changes are managed through configurable forms, lists and workflows. Its low-code approach allows administrators to tailor the platform to organizational needs using configuration and scripting.

2. Incident Management

Incident Management is an ITIL-aligned process whose goal is to restore normal service operation as quickly as possible and minimize adverse impact on business operations. In ServiceNow, an incident record captures details such as the caller, category, impact, urgency, priority, assignment group and description. The record passes through states such as New, In Progress, On Hold, Resolved and Closed.

3. Client Scripts

A Client Script is JavaScript that runs on the client side, that is, in the user's web browser, when a form is loaded, changed or submitted. It uses the client-side *g_form* API to get and set field values, show messages and control field behaviour. Client Scripts are suitable for validation and instant user feedback.

4. UI Policies

A UI Policy dynamically changes the behaviour of information on a form and controls the visibility of fields. It evaluates a condition and then applies UI Policy Actions to specified fields, such as making them mandatory, visible or read-only. UI Policies can be created without scripting, which makes them easy to maintain.

5. Client Script versus UI Policy

Aspect	Client Script	UI Policy
Implementation	JavaScript code	Conditions and actions (scripting optional)
Execution	onLoad, onChange, onSubmit, onCellEdit	On form load and whenever conditions change
Best used for	Validation, messages, custom logic	Mandatory, visible and read-only control
Maintenance	Requires coding knowledge	Easier, mostly configuration
