

8.3 Client Script Outcome

Phase 8 - Conclusion and Future Enhancements | Implement Client Script & UI Policy (Incident)

1. Outcome of the Client Script

The onChange Client Script on the Priority field of the Incident form achieved its purpose. When an agent sets Priority to 1 - Critical the script immediately shows an information message, and when the priority is changed to another value it clears the message. The script is skipped during form load, so agents do not see unwanted messages when opening existing records.

2. Outcome Against Requirements

Requirement	Outcome	Result
CS-01 Trigger on Priority change	Script runs on every Priority change	Achieved
CS-02 Critical message	Message displayed for Priority 1	Achieved
CS-03 Clear message	Message removed for other priorities	Achieved
CS-04 Ignore form load	No message shown on form open	Achieved
CS-05 Non-blocking	Save is not blocked by the script	Achieved
CS-06 Table restriction	Applies only to Incident table	Achieved

3. Benefits Realized

- Faster awareness of critical incidents by service desk agents.
- Cleaner form as outdated messages are removed automatically.
- Improved understanding of client-side scripting in ServiceNow.
