

6.1 Integration Overview

Phase 6 - Integration and Functional Validation | Implement Client Script & UI Policy (Incident)

1. Overview

The Client Script and UI Policies are configured independently but operate together on the same Incident form. Integration means that both components respond correctly to the same user actions, such as changing Priority or State, and together deliver the complete required form behaviour.

2. Components Working Together

Component	Trigger	Result
Client Script (onChange, Priority)	Priority value changes	Displays or clears the critical incident message
UI Policy UP-01	State is On Hold	On hold reason visible and mandatory
UI Policy UP-02	Priority is 1 - Critical	Assignment group mandatory
UI Policy UP-03	State is Closed	Short description and Category read-only

3. Execution Flow

Step	Event	Action
1	Agent opens the Incident form	onLoad UI Policies are evaluated; the onChange script is skipped as isLoading is true
2	Agent changes Impact or Urgency	Priority is recalculated; the Client Script runs
3	Priority becomes 1 - Critical	Info message is shown and UP-02 marks Assignment group mandatory
4	Agent changes State	UI Policy conditions are re-evaluated and field behaviour is updated
5	Agent clicks Save/Update	Mandatory checks are enforced; the record is saved only if valid

4. Integration Objective

The objective is to confirm that the two components do not conflict, and that together they provide guidance (Client Script) and enforcement (UI Policy) for a consistent incident-handling experience.
