

6.3 Incident Form Behaviour

Phase 6 - Integration and Functional Validation | Implement Client Script & UI Policy (Incident)

1. Overall Form Behaviour

After configuration, the Incident form behaves dynamically. Field properties and messages change in real time depending on the values selected by the agent. This section summarizes the behaviour of the form under different conditions.

2. Behaviour Matrix

Condition	Field / Element	Behaviour
Priority = 1 - Critical	Form message area	Critical incident information message displayed
Priority = 1 - Critical	Assignment group	Mandatory (marked with asterisk)
Priority not 1	Form message area	Message cleared
Priority not 1	Assignment group	Returns to default (not mandatory)
State = On Hold	On hold reason	Visible and mandatory
State not On Hold	On hold reason	Hidden and not mandatory
State = Closed	Short description	Read-only
State = Closed	Category	Read-only
State not Closed	Short description, Category	Editable

3. Save Behaviour

When the agent clicks Save or Update, ServiceNow checks all mandatory fields. If any mandatory field made mandatory by a UI Policy is empty, the save is blocked and an error message lists the missing fields. Once valid values are provided the record is saved successfully.

4. User Experience

- Agents see only relevant fields at each stage of the incident.
- Critical incidents are highlighted immediately.
- Closed incidents are protected from accidental modification.
