

2.1 Requirement Overview

Phase 2 - Requirement Analysis | Implement Client Script & UI Policy (Incident)

1. Purpose of Requirement Analysis

Requirement analysis identifies what the system must do and the conditions under which it must operate. For this project it defines the behaviours required on the ServiceNow Incident form, so that the Client Script and UI Policies can be designed, configured and tested against clear and measurable criteria.

2. Requirement Gathering Approach

- Study of the standard Incident form and its fields in the ServiceNow instance.
- Review of ServiceNow documentation on Client Scripts and UI Policies.
- Identification of common service desk needs such as guidance and mandatory data.
- Documentation and categorization of requirements with unique IDs.

3. Requirement Categories

Category	ID Prefix	Description
Functional	FR	Behaviours the system must perform
Non-Functional	NFR	Quality attributes such as performance and usability
Client Script	CS	Requirements for the client-side script
UI Policy	UP	Requirements for field behaviour rules

4. Stakeholders

Stakeholder	Interest
Service Desk Agent	Uses the Incident form daily to log and resolve incidents
ServiceNow Administrator	Configures and maintains the customization
Service Desk Manager	Needs reliable and complete incident data
End User / Caller	Expects quick and correct handling of the issue

5. Assumptions and Constraints

- A ServiceNow Personal Developer Instance with admin access is available.
- The standard Incident table and form are used without heavy modification.
- Only client-side customization is in scope; no server-side scripts are used.
