

7.1 Testing Methodology

Phase 7 - Testing and Results | Implement Client Script & UI Policy (Incident)

1. Testing Objective

The objective of testing is to verify that the Client Script and UI Policies function as specified in the requirements and that the Incident form behaves correctly for valid and invalid actions.

2. Testing Approach

Type	Description
Functional testing	Checks each requirement (FR, CS, UP) against actual form behaviour
Positive testing	Uses valid inputs to confirm expected behaviour occurs
Negative testing	Uses invalid actions, such as saving without a mandatory field
Regression testing	Confirms standard Incident functions are unaffected
Black-box testing	Testing from the user's perspective without examining code

3. Test Environment

Item	Details
Instance	ServiceNow Personal Developer Instance
User	System Administrator; other roles via impersonation
Table / Form	Incident [incident], default form view
Browser	Google Chrome (latest)

4. Test Procedure

- Open a new or existing incident from the Incident application.
- Perform the input action, for example change Priority or State.
- Observe the message and the field behaviour on the form.
- Compare the observed result with the expected result and record the status.

5. Entry and Exit Criteria

Entry: the Client Script and UI Policies are active and the environment is accessible. **Exit:** all planned test cases are executed and all critical test cases pass.
