

7.3 Client Script Testing

Phase 7 - Testing and Results | Implement Client Script & UI Policy (Incident)

1. Client Script Test Cases

Client Script testing verifies the onChange script attached to the Priority field of the Incident table.

TC ID	Input (Priority)	Expected Result	Status
TC-CS01	Change from 4 - Low to 1 - Critical	Info message is displayed	Pass
TC-CS02	Change from 1 - Critical to 2 - High	Message is cleared	Pass
TC-CS03	Change Impact and Urgency to High/High	Priority becomes 1; message displayed	Pass
TC-CS04	Change from 3 - Moderate to 4 - Low	No message is displayed	Pass
TC-CS05	Open form (isLoading = true)	Script does not run any logic	Pass
TC-CS06	Save incident while message is shown	Save is not blocked by the script	Pass

2. Verification Method

- Observation of the message area on the Incident form after each change.
- Checking the browser developer console for script errors (none observed).
- Repeating the test with different Impact and Urgency combinations.

3. Result

The Client Script executed only when the Priority value changed, displayed the message exactly for Priority 1 - Critical, and cleared it otherwise. No JavaScript errors were reported.
